Recap the plot. Along with its metabolic role, GAPDH has been shown to play a particular role in the binding to and the assembly of several cytoskeletal structural components, such as the bundling of microtubules and actin filaments. The physical interaction of GAPDH with cytoskeleton proteins, such as soluble tubulin heterodimer, microtubule, and microtubule-associated proteins, tau and MAP1B, has been previously demonstrated. MAPs have been shown to increase the physical interaction of GAPDH with microtubules, including its function in promoting microtubule bundling. GAPDH has also been shown to bind to the actin filament. Recently, Jung et al. ResearchArticleOpenAccess.Box 7 Sheehan, Murray.
